## INTERNATIONAL SEARCH REPORT

(PCT Article 18 and Rules 43 and 44)

Applicant's or agent's file reference <b>P18142A/BOU</b>	<b>FOR FURTHER ACTION</b> see Notification of Transmittal of International Search Report (Form PCT/ISA/220) as well as, where applicable, item 5 below.	
International application No. <b>PCT/GB 98/ 01597</b>	International filing date (day/month/year) <b>01/06/1998</b>	(Earliest) Priority Date (day/month/year) <b>31/05/1997</b>
Applicant <b>GILTECH LIMITED et al.</b>		

This International Search Report has been prepared by this International Searching Authority and is transmitted to the applicant according to Article 18. A copy is being transmitted to the International Bureau.

This International Search Report consists of a total of 3 sheets.

☒ It is also accompanied by a copy of each prior art document cited in this report.

1. ☐ **Certain claims were found unsearchable** (see Box I).

2. ☐ **Unity of invention is lacking** (see Box II).

3. ☐ The international application contains disclosure of a **nucleotide and/or amino acid sequence listing** and the international search was carried out on the basis of the sequence listing

☐ filed with the international application.

☐ furnished by the applicant separately from the international application,

☐ but not accompanied by a statement to the effect that it did not include matter going beyond the disclosure in the international application as filed.

☐ Transcribed by this Authority

4. With regard to the **title**, ☒ the text is approved as submitted by the applicant

☐ the text has been established by this Authority to read as follows:

5. With regard to the **abstract**,

☐ the text is approved as submitted by the applicant

☒ the text has been established, according to Rule 38.2(b), by this Authority as it appears in Box III. The applicant may, within one month from the date of mailing of this International Search Report, submit comments to this Authority.

6. The figure of the **drawings** to be published with the abstract is:

Figure No. ---- ☐ as suggested by the applicant.

☐ None of the figures.

☐ because the applicant failed to suggest a figure.

☐ because this figure better characterizes the invention.

## Box III TEXT OF THE ABSTRACT (Continuation of item 5 of the first sheet)

There is provided a method for forming a water-soluble glass fibre or wool. The method comprises heating the glass composition above its melting point to produce a molten glass and then cooling the molten glass slowly to a pre-selected working temperature at which the fibres will be drawn. Suitable working temperature include those in a range of 400 to 1000° C. The working temperature will usually be at least 200°C lower than the temperature to which the molten glass is heated above its melting point and may be 50-300°C above the Tg of the glass. Phosphorous pentoxide is suitable as a glass former and B2O3 may be present as an additive. Optionally the glass may release silver ions, e.g. by addition of silver orthophosphate during manufacture of the glass.

## INTERNATIONAL SEARCH REPORT

International Application No.

PCT/GB 98/01597

## A. CLASSIFICATION OF SUBJECT MATTER

IPC 6 C03C13/00 C03B37/02

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 6 C03B C03C

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	EP 0 578 023 A (CORNING INC) 12 January 1994 see page 4, line 20 - page 5, line 34; claim 4; tables I-III ---	1-6
A	WO 86 04807 A (UNIVERSITY OF DAYTON, US) 28 August 1986 cited in the application see claims 1-5 ---	1
A	WO 92 07801 A (ZIMMER INC) 14 May 1992 cited in the application see claims 1,7,8 ---	1
	--- -/--	

Further documents are listed in the continuation of box C.

Patent family members are listed in annex.

## \* Special categories of cited documents :

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier document but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

"&amp;" document member of the same patent family

International Patent Classification (IPC) or national classification and IPC C03C13/00		
Applicant GILTECH LIMITED et al.		

1. This international preliminary examination report has been prepared by this International Preliminary Examining Authority and is transmitted to the applicant according to Article 36.

2. This REPORT consists of a total of 4 sheets, including this cover sheet.

- ☐ This report is also accompanied by ANNEXES, i.e. sheets of the description, claims and/or drawings which have been amended and are the basis for this report and/or sheets containing rectifications made before this Authority (see Rule 70.16 and Section 607 of the Administrative Instructions under the PCT).

These annexes consist of a total of sheets.

3. This report contains indications relating to the following items:

- I ☒ Basis of the report
- II ☐ Priority
- III ☐ Non-establishment of opinion with regard to novelty, inventive step and industrial applicability
- IV ☐ Lack of unity of invention
- V ☒ Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement
- VI ☐ Certain documents cited
- VII ☐ Certain defects in the international application
- VIII ☐ Certain observations on the international application

# INTERNATIONAL PRELIMINARY EXAMINATION REPORT

International application No. PCT/GB98/01597

## I. Basis of the report

1. This report has been drawn on the basis of *(substitute sheets which have been furnished to the receiving Office in response to an invitation under Article 14 are referred to in this report as "originally filed" and are not annexed to the report since they do not contain amendments.)*:

### Description, pages:

1-17 as originally filed

### Claims, No.:

1-10 as originally filed

2. The amendments have resulted in the cancellation of:

- ☐ the description, pages:  
☐ the claims, Nos.:  
☐ the drawings, sheets:

3. ☐ This report has been established as if (some of) the amendments had not been made, since they have been considered to go beyond the disclosure as filed (Rule 70.2(c)):

4. Additional observations, if necessary:

## V. Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

### 1. Statement

Novelty (N)	Yes:	Claims	9,10 yes
	No:	Claims	1-8 no
Inventive step (IS)	Yes:	Claims	9,10 yes
	No:	Claims	1-8 no
Industrial applicability (IA)	Yes:	Claims	1-10 yes
	No:	Claims

---

2. Citations and explanations

**see separate sheet**

---

**INTERNATIONAL PRELIMINARY  
EXAMINATION REPORT - SEPARATE SHEET**

---

International application No. PCT/GB98/01597

1) Reference is made to the following documents:

---

D1: ~~EP-A-0578023~~

D2: WO 86 04807 (cited in the application page 3, line 5)

D3: WO 9207801 (cited in the application page 3, line 22).

2) The present application does not fulfil the requirements of Article 33(2) PCT:  
The subject-matter of claims 1-8 of the present application is known from  
D1( page 2, lines 49-56; page 4, line 20 -page 5, line 34; claim 4; tables I-III).  
Also the subject-matter of D2 (claims 1-5) and D3 (claims 1,7,8) is novelty destroying  
for claim 1 of the present application.

3) None of the cited documents discloses or suggests a method wherein a silver ion  
releasing glass is manufactured (claims 9, 10 of the present application).

The demand must be filed directly with the competent International Preliminary Examining Authority or, if two or more Authorities are competent, with the one chosen by the applicant. The full name or two-letter code of that Authority may be indicated by the applicant on the line below:

IPEA/ US

 Lexington, KY 40550  
 US

Telephone No.:

859-232-7843

Facsimile No.:

859-232-7850

Teleprinter No.:

☐ Address for correspondence: Mark this check-box where no agent or common representative is/has been appointed and the space above is used instead to indicate a special address to which correspondence should be sent.

**Box No. IV BASIS FOR INTERNATIONAL PRELIMINARY EXAMINATION**

Statement concerning amendments:\*

1. The applicant wishes the international preliminary examination to start on the basis of:

☒ the international application as originally filed  
 the description ☒ as originally filed  
☐ as amended under Article 34

the claims ☒ as originally filed  
☐ as amended under Article 19 (together with any accompanying statement)  
☐ as amended under Article 34

the drawings ☒ as originally filed  
☐ as amended under Article 34

2. ☐ The applicant wishes any amendment to the claims under Article 19 to be considered as reversed.3. ☐ The applicant wishes the start of the international preliminary examination to be postponed until the expiration of 20 months from the priority date unless the International Preliminary Examining Authority receives a copy of any amendments made under Article 19 or a notice from the applicant that he does not wish to make such amendments (Rule 69.1(d)). *(This check-box may be marked only where the time limit under Article 19 has not yet expired.)*

\* Where no check-box is marked, international preliminary examination will start on the basis of the international application as originally filed or, where a copy of amendments to the claims under Article 19 and/or amendments of the international application under Article 34 are received by the International Preliminary Examining Authority before it has begun to draw up a written opinion or the international preliminary examination report, as so amended.

Language for the purposes of international preliminary examination:

English

☒ which is the language in which the international application was filed.  
☐ which is the language of a translation furnished for the purposes of international search.  
☐ which is the language of publication of the international application.  
☐ which is the language of the translation (to be) furnished for the purposes of international preliminary examination.

**Box No. V ELECTION OF STATES**

The applicant hereby elects all eligible States (that is, all States which have been designated and which are bound by Chapter II of the PCT)

excluding the following States which the applicant wishes not to elect:

Sheet No. 3

International application No.

## Box No. VI CHECK LIST

The demand is accompanied by the following elements, in the language referred to in Box No. IV, for the purposes of international preliminary examination:

- |  |   |   |        |
|--|---|---|--------|
| 1. translation of international application                              | : | 0 | sheets |
| 2. amendments under Article 34   | : | 0 | sheets |
| 3. copy (or, where required, translation) of amendments under Article 19 | : | 0 | sheets |
| 4. copy (or, where required, translation) of statement under Article 19  | : | 0 | sheets |
| 5. letter  | : | 0 | sheets |
| 6. other (specify)   | : | 0 | sheets |

<b>(54) Title:</b> METHOD OF PRODUCING WATER-SOLUBLE GLASS FIBRES		
<b>(57) Abstract</b>  There is provided a method for forming a water-soluble glass fibre or wool. The method comprises heating the glass composition above its melting point to produce a molten glass and then cooling the molten glass slowly to a pre-selected working temperature at which the fibres will be drawn. Suitable working temperature include those in a range of 400 to 1000 °C. The working temperature will usually be at least 200 °C lower than the temperature to which the molten glass is heated above its melting point and may be 50-300 °C above the T <sub>g</sub> of the glass. Phosphorous pentoxide is suitable as a glass former and B <sub>2</sub> O <sub>3</sub> may be present as an additive. Optionally the glass may release silver ions, e.g. by addition of silver orthophosphate during manufacture of the glass.

1     **"Method of Producing Water-Soluble Glass Fibres"**

2

3     The present invention relates to a method for the  
4     production of water soluble glass fibres and glass  
5     wool.

6

7     It is known that certain glasses, in which the usual  
8     glass former, silicon dioxide, is replaced with  
9     phosphorous pentoxide, are soluble in water and body  
10    fluids. The rate of dissolution is controlled largely  
11    by the addition of glass modifiers such as calcium  
12    oxide. In simple terms, the greater the concentration  
13    of the modifier the slower the rate of dissolution.  
14    The rate of dissolution may range from minutes through  
15    to several years.

16

17    Soluble phosphate based glasses which have demonstrated  
18    good biocompatibility can incorporate inorganic metals  
19    such that a sustained release of the metals can be  
20    provided at the wound site. Such materials can also  
21    find use in mechanical applications where, for example,  
22    slow release of an anti-corrosion agent may be  
23    beneficial.

24

25    Certain applications require that the glass is in the

1 form of wool or fibres for mechanical applications such  
2 as insulation wool and packaging. Thus, for example,  
3 Mohr et al in "Fibre Glass" (Van Norstrand, Reinhold  
4 Company, New York 1978) and Jaray in "A New Method of  
5 Spinning Glass Fibres" (28th Annual SPI RP/C Institute  
6 proceedings 1973, Section 3-A) describe the production  
7 of wool and fibres, respectively, from molten glass.  
8 The glass fibres can be used for insulation,  
9 construction or even communication purposes. Glass  
10 wool also finds uses in packaging and insulation  
11 applications.

12  
13 Normally, glass fibres are produced from molten glass  
14 using traditional fibre pulling techniques; whereby  
15 filaments of high temperature molten glass (850°-  
16 1300°C) are formed into strands and stretched over pull  
17 rolls before being collected onto a reel.

18  
19 Glass wool formation is similar in that the glass is  
20 initially melted in a crucible. The crucible has  
21 suitable apertures to allow filaments of glass to flow  
22 downwards, which are then "blown" into wool using jets  
23 of either steam or compressed air. Alternatively,  
24 glass wool can be formed using a flame attenuation  
25 process, developed by Owens-Corning Fibreglass  
26 Corporation circa 1940. In this process molten glass  
27 passes through a bushing stage where primary filaments  
28 approximately 1 mm wide are formed. The fibres are  
29 then aligned into an exact uniformly juxtaposed array,  
30 using a fibre guide, into a jet flame issuing from an  
31 internal combustion burner. The jet flame causes  
32 thinning and lengthening of the fibres before they are  
33 collected on a steel mesh belt.

34  
35 In both cases, the glass is either supplied in molten  
36 form direct from a crucible or from a temperature-

1 gradient furnace.

2

3 Generally, water soluble glasses do not lend themselves  
4 to these traditional fibre and wool forming techniques.  
5 As an example, US Patent 4,604,097 of Graves et al  
6 discloses a water soluble drawn fibre, composed  
7 primarily of calcium oxide and phosphorous pentoxide.  
8 The fibre produced has a very low tensile strength,  
9 compared to fibres spun from non-soluble glass  
10 compositions.

11

12 Further, water soluble glasses can also be chemically  
13 aggressive when molten, unlike traditional glasses  
14 where silicon dioxide is used as the glass former.  
15 Additionally, the fibres produced are prone to thermal  
16 shock and can suffer from devitrification or  
17 crystallisation.

18

19 To combat problems of devitrification and  
20 crystallisation, water soluble glass fibres have been  
21 previously produced in exacting conditions. Thus, for  
22 example, Zimmer et al in WO92/07801 discloses drawing  
23 fibres from a water soluble glass composed primarily of  
24 phosphorus pentoxide, calcium oxide and iron oxide. In  
25 order to keep the viscosity of the glass suitable for  
26 drawing, the fibres were drawn at 1200°C. Also as a  
27 result of the chemically aggressive nature of the glass  
28 at that temperature the glass was pulled in an oxygen  
29 rich atmosphere (as high as 80% oxygen by volume).  
30 Obviously the commercial production of glass fibres  
31 under these high temperature controlled atmospheric  
32 conditions is expensive.

33

34 The problems of working with water soluble glass are  
35 compounded by the very nature of the glass. Metal  
36 oxides of elements such as lead and tellurium have

1 previously been used in glass as additives to affect  
2 qualities of the glass; crystallisation temperature,  
3 viscosity and density, for example. As a result of  
4 environmental concerns and particularly when the  
5 glasses are to be used in a biological application  
6 these additives must be avoided and replaced by more  
7 acceptable alternatives.

8  
9 Therefore, it is an object of the present invention to  
10 provide environmentally acceptable water soluble glass  
11 fibres with suitable mechanical properties, and to  
12 produce said fibres under less forcing conditions.

13  
14 The present invention provides a method for forming a  
15 water-soluble glass fibre and/or glass wool, the method  
16 comprising producing a water-soluble glass and heating  
17 said glass above its melting point to form molten  
18 glass, cooling at least a portion of said molten glass  
19 to a pre-selected working temperature and then  
20 processing said molten glass having said working  
21 temperature into fibres and/or wool.

22  
23 Generally, the glass is initially heated to a melting  
24 temperature of 500°-1200°C, preferably 750°-1050°C.  
25 The temperature is then slowly lowered to the working  
26 temperature at which fibre formation occurs.

27  
28 Generally, the working temperature of the glass will be  
29 at least 200°C lower than the temperature at which the  
30 glass is initially heated. Suitable working  
31 temperatures may fall within the following ranges 400°-  
32 500°C, 500°-900°C (preferably 550°-700°C, more  
33 preferably 550°-650°C, especially 600°-650°C) and 800-  
34 1000°C. The working temperature selected will depend  
35 upon the glass composition, but an approximate  
36 indication of a suitable working temperature can be

1 established as hereinafter described. Depending upon  
2 the glass composition used, the working temperature may  
3 be a range of suitable temperatures. The range of  
4 working temperatures may be narrow, for example of only  
5 10°C, so that fibre formation may occur only between  
6 the temperature of N°C to (N+10)°C. Other glass  
7 compositions may have a wider temperature range for the  
8 working temperature in which glass formation is  
9 possible.

10  
11 Alternatively, the working temperature of the glass may  
12 be defined as 50-300°C above the T<sub>g</sub> of the glass.

13  
14 In order to obtain an approximate indication of the  
15 working temperature for any particular glass  
16 composition, the glass composition should be slowly  
17 heated to its melting point. As soon as the glass is  
18 molten, frequent attempts to pull the composition  
19 upwardly to form a fibre should be made, with the  
20 temperature of the composition being very gradually  
21 increased between attempts. The temperature range of  
22 the composition during which fibre formation is  
23 possible should be noted and used as a preliminary  
24 working temperature in the process of the invention.

25  
26 It will be clear to those skilled in the art that the  
27 pulling speed at which the fibre is drawn off can  
28 affect the choice of working temperature and the  
29 diameter of the fibre required. Where a fibre of  
30 relatively large diameter is required, the fibre tends  
31 to be pulled more slowly and the working temperature  
32 may need to be decreased slightly. Where a fibre of  
33 relatively small diameter is required (eg a glass  
34 wool), the fibres may be drawn at the much higher  
35 pulling speed and the working temperature may need to  
36 be increased (thus lowering the viscosity of the

1 composition to accommodate the increased pulling  
2 speed). Selection of the exact working temperature in  
3 respect of any particular fibre size and composition  
4 will be a simple matter of routine evaluation of  
5 optimal process conditions.

6  
7 With reference to the "working temperature" of the  
8 glass, the skilled person will appreciate that the  
9 furnace temperature may differ considerably from the  
10 temperature of the glass itself and indeed there may be  
11 a significant temperature gradient in the glass.  
12 Ideally the "working temperature" will be the  
13 temperature of the glass as fibre formation (ie.  
14 pulling) takes place. In many compositions however, it  
15 may not be practical to measure the temperature at the  
16 surface of the glass where pulling occurs by insertion  
17 of a temperature probe as the introduction of the probe  
18 may precipitate crystallisation of the glass. One  
19 alternative is to place a temperature probe into the  
20 bushing and to monitor the bushing temperature which  
21 will be a good indicator of the glass temperature at  
22 the moment of fibre formation. Alternatively an Infra  
23 Red pyrometer may be focused onto the appropriate area  
24 of the glass and used to monitor the temperature.

25  
26 The glass to be formed into fibres will generally be  
27 heated until molten, optionally clarified, and then  
28 cooled slowly and controllably until the appropriate  
29 working temperature is reached and fibre formation can  
30 commence. The initial heating of the glass above its  
31 melting point and the subsequent fibre formation may be  
32 carried out in a single vessel or, alternatively, the  
33 molten glass may be transferred to a vessel designed  
34 specifically for fibre formation. One way of holding  
35 the molten glass in a vessel having a bushing within  
36 its lower surface until the temperature drops to the

1 required working temperature is to coat or fill the  
2 holes of the bushing with a material that gradually  
3 melts over the period of time taken for the glass to  
4 reach the temperature required.

5  
6 The most important aspect of the present invention is  
7 the manner in which the working temperature is reached.  
8 We have found that the molten glass, which may  
9 preferably be heated significantly above its melting  
10 point, should be allowed to cool in a highly controlled  
11 manner, the temperature being only gradually reduced  
12 until the working temperature is reached. A stirrer  
13 may be present to ensure that the temperature of the  
14 whole of the molten glass is kept as uniform as  
15 possible.

16  
17 The glass is cooled to a temperature at which the glass  
18 will not crystallise for at least the period of time  
19 needed to convert the melt to fibre. This temperature  
20 is termed a "holding temperature". The rate of cooling  
21 from this holding temperature is determined by the rate  
22 at which the melt is consumed at the bushing and the  
23 difference in temperature between the bushing  
24 temperature (the working temperature) and the melt  
25 holding temperature.

26  
27 Due to low viscosity and narrow temperature band for  
28 many of these compositions, control of the balance  
29 between melt temperature, bushing temperature and glass  
30 throughput rate is critical.

31  
32 According to a further aspect of the present invention  
33 there is provided a composition suitable for processing  
34 into glass fibres and/or wool.

35  
36 Phosphorous pentoxide ( $P_2O_5$ ) is preferably used as the

1 glass former.

2

3 Generally the mole percentage of phosphorous pentoxide  
4 in the glass composition is less than 85%, preferably  
5 less than 60% and especially between 30-60%.

6

7 Alkali metals, alkaline earth metals and lanthanoid  
8 oxides or carbonates are preferably used as glass  
9 modifiers.

10

11 Generally, the mole percentage of alkali metals,  
12 alkaline earth metals and lanthanoid oxides or  
13 carbonates is less than 60%, preferably between 40-60%.

14

15 Boron containing compounds (eg  $B_2O_3$ ) are preferably used  
16 as glass additives.

17

18 Generally, the mole percentage of boron containing  
19 compounds is less than 15% or less, preferably less  
20 than 5%.

21

22 Other compounds may also be added to the glass to  
23 modify its properties, for example  $SiO_2$ ,  $Al_2O_3$ ,  $SO_3$ ,  
24 sulphate ions ( $SO_4^{2-}$ ) or transition metal compounds (eg.  
25 first row transition metal compounds).

26

27 Typically the soluble glasses used in this invention  
28 comprise phosphorus pentoxide ( $P_2O_5$ ) as the principal  
29 glass-former, together with any one or more  
30 glass-modifying non-toxic materials such as sodium  
31 oxide ( $Na_2O$ ), potassium oxide ( $K_2O$ ), magnesium oxide  
32 ( $MgO$ ), zinc oxide ( $ZnO$ ) and calcium oxide ( $CaO$ ). The  
33 rate at which the glass dissolves in fluids is  
34 determined by the glass composition, generally by the  
35 ratio of glass-modifier to glass-former and by the  
36 relative proportions of the glass-modifiers in the

1 glass. By suitable adjustment of the glass  
2 composition, the dissolution rates in water at 38°C  
3 ranging from substantially zero to 25mg/cm<sup>2</sup>/hour or more  
4 can be designed. However, the most desirable  
5 dissolution rate R of the glass is between 0.01 and  
6 2.0mg/cm<sup>2</sup>/hour.

7  
8 The water-soluble glass is preferably a phosphate  
9 glass, and preferably comprises a source of silver ions  
10 which may advantageously be introduced during  
11 manufacture as silver orthophosphate (Ag<sub>3</sub>PO<sub>4</sub>). The  
12 glass preferably enables controlled release of silver  
13 and other constituents in the glass and the content of  
14 these additives can vary in accordance with conditions  
15 of use and desired rates of release, the content of  
16 silver generally being up to 5 mole %. While we are  
17 following convention in describing the composition of  
18 the glass in terms of the mole % of oxides, of halides  
19 and of sulphate ions, this is not intended to imply  
20 that such chemical species are present in the glass nor  
21 that they are used for the batch for the preparation of  
22 the glass.

23  
24 The optimum rate of release of silver ions into an  
25 aqueous environment may be selected by circumstances  
26 and particularly by the specific function of the  
27 released silver. The invention provides a means of  
28 delivering silver ions to an aqueous medium at a rate  
29 which will maintain a concentration of silver ions in  
30 said aqueous medium of not less than 0.01 parts per  
31 million and not greater than 10 parts per million. In  
32 some cases, the required rate of release may be such  
33 that all of the silver added to the system is released  
34 in a short period of hours or days and in other  
35 applications it may be that the total silver be  
36 released slowly at a substantially uniform rate over a

1 period extending to months or even years. In  
2 particular cases there may be additional requirements,  
3 for example it may be desirable that no residue remains  
4 after the source of the silver ions is exhausted or, in  
5 other cases, where the silver is made available it will  
6 be desirable that any materials, other than the silver  
7 itself, which are simultaneously released should be  
8 physiologically harmless. In yet other cases, it may  
9 be necessary to ensure that the pH of the resulting  
10 solution does not fall outside defined limits.

11  
12 Generally, the mole percentage of these additives in  
13 the glass is less than 25%, preferably less than 10%.

14  
15 Embodiments of the invention will be described with  
16 reference to the following non-limiting examples.

17  
18 **Example 1**

19	Component	Mole %
20	Glass Composition	
21	Na <sub>2</sub> O	31.05
22	CaO	16.00
23	Ag <sub>2</sub> O	3.88
24	P <sub>2</sub> O <sub>5</sub>	46.08
25	Na <sub>2</sub> PO <sub>3</sub> F	0.97
26	2Al <sub>2</sub> O <sub>3</sub> .B <sub>2</sub> O <sub>3</sub>	2.00

27  
28 100 grams of the sample was heated to 900°C before  
29 being cooled and pulled at 650°C, at 25 km/hr. Overall  
30 the fibre was good; one sample was 10 km in length and  
31 11 grams in weight, although there was some  
32 crystallisation at the pulling temperature.

33

34

1     **Example 2**

2		Component	Mole %
3	Glass Composition		
4		Na <sub>2</sub> O	29.51
5		CaO	15.21
6		Ag <sub>2</sub> O	3.68
7		P <sub>2</sub> O <sub>5</sub>	43.80
8		2Al <sub>2</sub> O <sub>3</sub> .B <sub>2</sub> O <sub>3</sub>	1.90
9		Na <sub>2</sub> PO <sub>3</sub> F	1.90
10		Na <sub>2</sub> B <sub>4</sub> O <sub>7</sub> .10H <sub>2</sub> O	1.00
11		Na <sub>2</sub> PO <sub>4</sub>	3.00

12

13     74 grams of the sample was heated to 1000°C before  
14     being cooled and pulled at 635°C at 25 km/hr. The  
15     fibre produced was ultrafine; one sample was 18 km in  
16     length and 59 grams in weight. The sample was sprayed  
17     with WD40 to prevent water absorption and to aid  
18     lubricity. There was some debris at the bottom of the  
19     crucible, but this was found to be just iron deposits  
20     from the brushing rod.

21

22     **Example 3**

23

24		Component	Mole %
25	Glass Composition		
26		Na <sub>2</sub> O	34.20
27		CaO	16.15
28		P <sub>2</sub> O <sub>5</sub>	44.65
29		Na <sub>2</sub> SO <sub>4</sub>	5.00

30

31     200 grams of the sample was heated to 1050°C before  
32     being cooled and pulled at 635°C at 25 km/hr. The  
33     fibre was good although there was some crystallisation  
34     at the pulling temperature.

35

14

15

16     200 grams of the sample was heated to 850°C before  
17     being cooled to 545°C and pulled at 40 km/hr. The  
18     fibre produced was strong and thin; there was not a  
19     problem of crystallisation, in fact the glass can be  
20     stored at 550°C for 72 hours without the onset of  
21     crystallisation.

22

23     **Example 7**

24     Below is an example of a wool formulation and running  
25     conditions to illustrate the differences with the  
26     monofilament examples given above.

27

28     A typical wool formulation is

29

30	Na <sub>2</sub> O	26.31
31	CaO	17.78
32	P <sub>2</sub> O <sub>5</sub>	47.04
33	B <sub>2</sub> O <sub>3</sub>	5.94
34	MnO	1.55
35	Fe <sub>2</sub> O <sub>3</sub>	0.97
36	NaF	0.41

37

38     Solution rate, non annealed = 0.0278 mg.cm<sup>-2</sup>hr<sup>-1</sup>

1 Melted and refined at 1000°C.  
2 Cooled and held at 725°C.  
3 Bushing temperature maintained at 365°C.  
4  
5 Thick fibres approx 1.2mm diameter drawn through pinch  
6 rollers at 2.5 M.mm<sup>-1</sup> from a bushing with 6 x 6.5mm  
7 diameter holes. Fibres jet attenuated to produce a  
8 fine wool 5 -15µm diameter. The wool was sprayed with  
9 silicone oil finish during the attenuation process and  
10 collected on a stainless steel mesh conveyor.  
11 Typically, attenuated wools will have diameters of 5 to  
12 20µm. Monofilament fibres will mostly be 20 to 50µm  
13 diameter.  
14

15 **Example 8**

16	Na <sub>2</sub> O	31.19 mole %
17	K <sub>2</sub> O	9.63 mole %
18	Ag <sub>2</sub> O	2.9 mole %
19	B <sub>2</sub> O <sub>3</sub>	2.74 mole %
20	2NaF	0.66 mole %
21	P <sub>2</sub> O <sub>5</sub>	52.88 mole %

22 Furnace at 710°C - 800°C.  
23 Bushing at 450°C - 460°C.  
24 4.5mm bushing holes.  
25 50km per hour pull rate.  
26 Good fibres.  
27 Solution rate = 1.68 not annealed 2.28 annealed.  
28

29 **Example 9**

30	Na <sub>2</sub> O	32 mole %
31	K <sub>2</sub> O	10 mole %
32	Ag <sub>2</sub> O	3 mole %
33	P <sub>2</sub> O <sub>5</sub>	55 mole %

34

35

36

37

38

1 Furnace at 850°C.  
2 Bushing at 530°C.  
3 5mm bushing holes.  
4 55kmph.  
5 Good strong fibres.

6

7 **Example 10**

8	Na <sub>2</sub> O	32 mole %
9	K <sub>2</sub> O	10 mole %
10	(MgO	4 mole %) - added as an anti-microbial
11	B <sub>2</sub> O <sub>3</sub>	5 mole %
12	Ag <sub>2</sub> O	3 mole %
13	P <sub>2</sub> O <sub>5</sub>	46 mole %

14

15 Furnace temperature 650°C - 730°C.  
16 Bushing temperature 410°C - 420°C.  
17 Bushing 5.5mm diameter.  
18 Speed up to 100kmph.  
19 Solution rate 0.7 annealed 1.0 non annealed (mg.cm<sup>-3</sup>.hr<sup>-1</sup>).  
20 Very good strong reliable fibre. Very stable.

21

22 **Example 11**

23	Na <sub>2</sub> O	36.68 mole %
24	K <sub>2</sub> O	8.63 mole %
25	P <sub>2</sub> O <sub>5</sub>	45.09 mole %
26	B <sub>2</sub> O <sub>3</sub>	5.29 mole %
27	Ag <sub>2</sub> O	2.59 mole %
28	(CaO	1.73 mole % to attenuate solution rate!

29

30 Furnace temperature 550°C.  
31 Bushing 62 x 5.0mm holes.  
32 Bushing temperature 400°C.  
33 Speed 80kmph.  
34 Very good fibres.  
35 Solution rate 3.11 annealed, 3.8 non annealed (mg.cm<sup>-2</sup>.hr<sup>-1</sup>).  
36

37 The fibres show excellent tensile strength, flexibility  
38 and shock resistance.

1 The fibres are especially suitable for industrial and  
2 plastics reinforcement controlled release (anti-  
3 microbial, anti-corrosion etc) and rapidly  
4 biodegradable applications.  
5

6 **Example 12**

7	CaO	30 mole %
8	MgO	20 mole %
9	P <sub>2</sub> O <sub>5</sub>	50 mole %

10

11 Furnace at 1050°C.

12 Bushing 5.5mm holes.

13 Bushing temperature 700°C - 720°C.

14 Speed up to 80kmph.

15 Solution rate TBA.

16 Very strong fibre.  
17

18 **Example 13**

19	(K <sub>2</sub> O	5 mole %)	Trace to alter dissolution rate
20	CaO	25 mole %	
21	Mg <sub>2</sub> O	20 mole %	
22	P <sub>2</sub> O <sub>5</sub>	50 mole %	

23

24 Furnace 1000°C.

25 Bushing 5.5mm.

26 Bushing temperature 560°C - 620°C.

27 Speed up to 70kmph.

28 Solution rate TBA.

29 Very strong fibre.

30 Anti-microbial.  
31

32 **Example 14**

33	CaO	28.5 mole %
34	MgO	18.5 mole %
35	Ag <sub>2</sub> O	3 mole %
36	P <sub>2</sub> O <sub>5</sub>	50 mole %

37

38

- 1 Furnace temperature 1050°C - 1150°C.
- 2 Bushing 4 x 5.5mm.
- 3 Bushing temperature 700°C.
- 4 Speed 50kmph.
- 5 Solution rate TBA.
- 6 Very good, strong fibre.
- 7 Anti-microbial.

8

9 **Example 15**

- |    |                               |           |
|----|-------------------------------|-----------|
| 10 | CaO                           | 30 mole % |
| 11 | MgO                           | 20 mole % |
| 12 | P <sub>2</sub> O <sub>5</sub> | 50 mole % |

13

- 14 As Example 14 (without silver)

15

- 16 The fibres show excellent tensile strength, flexibility  
17 and shock resistance. These fibres are suitable for  
18 applications requiring slower release and greater  
19 tensile strength plus biodegradability. The fibres are  
20 suitable for orthopaedic implants and tissue  
21 engineering applications.

22

23

24

1     **Claims**

- 2
- 3     1.    A method for forming water-soluble glass fibres,  
4           the method comprising providing a composition  
5           suitable for producing a water-soluble glass and  
6           heating said composition above the melting point  
7           of said glass to form a molten glass, cooling at  
8           least a portion of said molten glass to a pre-  
9           selected working temperature and then processing  
10          said molten glass having said working temperature  
11          into fibres.
- 12
- 13    2.    A method as claimed in Claim 1 wherein said  
14          portion of said molten glass is cooled slowly to  
15          said working temperature.
- 16
- 17    3.    A method as claimed in either one of Claims 1 and  
18          2 wherein said working temperature is 50-300°C  
19          above the Tg of the glass.
- 20
- 21    4.    A method as claimed in either one of Claims 1 and  
22          2 wherein said working temperature is at least  
23          200°C below the temperature to which the glass is  
24          initially heated.
- 25
- 26    5.    A method as claimed in any one of Claims 1 to 4  
27          wherein glass wool is formed.
- 28
- 29    6.    A method as claimed in any one of Claims 1 to 5  
30          wherein phosphorous pentoxide is used as the glass  
31          former.
- 32
- 33    7.    A method as claimed in any one of Claim 6 wherein  
34          boron containing compounds are used as glass  
35          modifiers.
- 36
- 37    8.    A method as claimed in Claim 7 wherein B<sub>2</sub>O<sub>3</sub> is used  
38          as a glass modifier at a mole percentage of 15% or

1           less.

2

3       9.    A method as claimed in any one of Claims 1 to 8  
4           wherein said glass is a silver-ion releasing  
5           glass.

6

7       10.  A method as claimed in Claim 9 wherein silver  
8           orthophosphate is added during manufacture of the  
9           glass as a source of silver ions.

# INTERNATIONAL SEARCH REPORT

International Application No.

PCT/GB 98/01597

## A. CLASSIFICATION OF SUBJECT MATTER

IPC 6 C03C13/00 C03B37/02

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 6 C03B C03C

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	EP 0 578 023 A (CORNING INC) 12 January 1994 see page 4, line 20 - page 5, line 34; claim 4; tables I-III ---	1-6
A	WO 86 04807 A (UNIVERSITY OF DAYTON, US) 28 August 1986 cited in the application see claims 1-5 ---	1
A	WO 92 07801 A (ZIMMER INC) 14 May 1992 cited in the application see claims 1,7,8 --- -/--	1

Further documents are listed in the continuation of box C.

Patent family members are listed in annex.

### " Special categories of cited documents :

- "A" document defining the general state of the art which is not considered to be of particular relevance
- "E" earlier document but published on or after the international filing date
- "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- "O" document referring to an oral disclosure, use, exhibition or other means
- "P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

"&" document member of the same patent family
